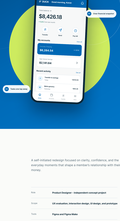
PRODUCT DESIGNER · CONCEPT · MOBILE BANKING

Everyday banking, *made clearer.*

I explored how DUCA's mobile experience could help members understand their finances and complete routine tasks with greater confidence.

Role	Scope	Focus
Product Designer	Independent concept project	Mobile banking

Where I'll contribute ↓



Overview

DUCA is an Ontario credit union with a recognisable blue identity. I treated that familiarity as an asset, while rethinking how balances, activity, and money movement could work as one coherent experience.

I focused on the core account flow: balances, activity, and transfers. I left out bill payments, card controls, and loan services to keep the concept clear and the scope realistic. It is to make one area easier to find, read, and trust.

A self-initiated redesign focused on clarity, confidence, and the everyday moments that shape a member's relationship with their money.

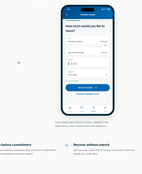
Role	Product Designer · Independent concept project
Scope	UX evaluation, interaction design, UI design, and prototype
Tools	Figma and FigJam/Miro
Timeline	8 weeks

Help members understand their finances and complete everyday banking tasks with confidence.

Challenge

I began by evaluating the interface to identify potential usability issues, while recognizing that user research was needed to understand customers' needs.

Opening screen of the current app



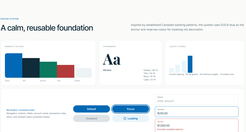
Main menu, Bill Pay, and Deposit screens

Hypothesis for validation

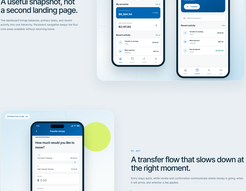
How might I make DUCA's core account information and money-movement tasks easier to understand, while preserving the reassurance and familiarity members expect from their financial institution?

Solution

I redesigned the experience with a clear financial overview, consistent navigation, and a guided transfer flow, helping users understand their finances and move money with confidence.



Transfer between my accounts



Main menu, Bill Pay, and Deposit screens

- **Control beside decisions** — Balances, account numbers, and transfer limits are visible where members make decisions, reducing the need to navigate away.
- **Review before commitment** — Transfers include a review step that confirms the amount, source, and destination before money moves.
- **Recover without rework** — Errors are caught before submission, so a wrong number doesn't force the whole flow to start over.

Designing with Product and Engineering

Align
Mapped dependencies across services and teams to prioritize.

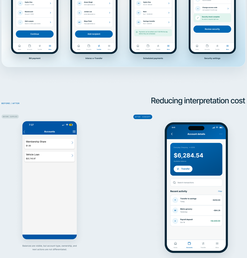
Refine
Collaborated on edge cases, timing, and success metrics.

Deliver
Shipped in phases, validating with real users.

Iterate
Measured outcomes, gathered feedback, and refined the next release.

A calm, reusable foundation

Inspired by established Canadian banking patterns, the system uses DUCA blue as the anchor and maximizes clarity for meaning-rich typography.



Foundations
Color, type, spacing, elevation, icons, controls, focus treatment, and motion rules apply across the product.

Feature-specific
Patterns for data entry, summaries, charts, and account balances, developed in Figma and handed to engineering early.

Proposed governance
Shared ownership between design and engineering, with tokens, reviews, and documentation to keep the system consistent as it grows.

App screens

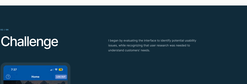
A cohesive set of screens turns scattered account information into a clear journey from awareness to action.

A useful snapshot, not a second landing page.

The dashboard gives members a clear snapshot of their account activity, into one heading. Persistent navigation keeps the four core areas available without returning home.

A transfer flow that slows down at the right moment.

Every unique quick, while review and confirmation communicate where money is going, when it will arrive, and whether it is the right time.



One system for the rest of everyday banking.

Supporting tasks use the same navigation, list patterns, controls, and status language, helping the app feel consistent from the first tap to completed money-related tasks.

Reducing interpretation cost

Improved balance hierarchy, clearer labels, and a more consistent transaction list in the right.

Impact

Because this is an unlested concept, I'll write impact as intended outcomes and define how I would assess them.

Clarity
Members can find balances and recent activity without decoding dense or confusing screens.

Confidence
Members can review details before moving money, so they don't have to second-guess their decisions.

Recovery
Members can correct mistakes and access messages easily when they're unsure or run into edge cases.

Test comprehension, not preference.

Moderated 5–7 sessions using a realistic prototype and fictional data. Ask participants to think aloud, avoiding leading language.

Task 01	Task 02	Task 03
Find the chequing balance and most recent transaction.	Transfer $200 from chequing to savings.	Identify and correct an amount that exceeds the balance.

Task completion · Error recovery · Time to task · Confidence interview

Results & reflection

The concept delivered a contained product story from evaluation and system foundations to an interactive money-movement journey.

CONCEPT DELIVERABLES

- Heuristic interface evaluation
- Information architecture and task flows
- Prioritized improvement opportunities
- Wireframes and high-fidelity UI
- Reusable design system foundations
- Usage, success, and usability measures

NEXT STEPS

- Add bill payments and mobile deposit flows
- Conduct moderated usability testing sessions
- Refine dynamic data and error scenarios
- Align business rules with finance and engineering
- Run accessibility, comprehension & heuristic reviews

DUCA

Clear decisions create *confident moments.*
